

Successful use of Carrier Current devices is long standing. The proposed Access BPL uses "Spread Spectrum" which widens the potential interference to all licensed entities. "Spread Spectrum" is like spreading manure over a large area, it is still manure. I have seen and heard the interference from BPL and it produces an unacceptable increase to existing interference levels. I question the ability of BPL entities to acknowledge and correct interference from their devices. Electric power companies are notorious for ignoring complaints of "line noise" from their delivery system. Electrical power users should not have to subsidize BPL with increased electricity use charges.
